Control of the passband in narrow-band filters

TEXT:

The object of this article is to examine the possibilities of controlling the passband of polynomial filters and of filters with attenuation peaks, or, rather, to examine them more thoroughly than this has been done until now. It is assumed that the control of the band must not change the shape of the selectivity characteristic. After an analysis of the conditions to be satisfied in polynomial filters of various type= (k, m, VI and VI' types), the authors deal with the electrical control of the passband, such as it was first worked out in the Odessa Communication Institute in 1958 - 1959 and permitting to achieve an automatic or a remote control (and also to reduce the size and to simplify the construction of radio-apparatuses). To realize this control, it is possible to use ferrovariometers, controlled capacitors and also some electronic systems transforming the wave-impedance of the circuits. Point-contact diodes

TITLE:

Synthesis of polynomial band-pass filters with the Chebyshev characteristic of selectivity

PERIODICAL:

Elektrosvyaz', no. 2, 1961, 60 - 69

TEXT:

In the calculation of iterative band-pass filters, the method evolved by V. Kauer and S. Darlington is generally resorted to. This method was namely used by M. Dishal [Ref. 2: Dishal. "Design of dissipative band-pass filters producing desired exact amplitude-frequency characteristics." PIRE, 37. September 1949]. The author of the present article begins by reproducing the essential part of Dishal's theoretical calculations. Then, using these calculations and some fundamental equations of the Chebyshev's filter synthesis, he deduces a set of formulae giving the attenuation and the coupling coefficients in the cases of a three-circuit and of a four-circuit filter respectively. For each of these filter-types he analyses the cases of symmetrical and asymmetrical distribution of attenuation and coupling. His conclusion is that filters with a symmetrical distribution are more advantageous for band control. He then examines briefly the cases of a five-circuit and of a six-circuit filter. The

Synthesis of polynomial band-pass filters ...

correctness of the formulae obtained by him was checked experimentally. The general conclusion is that these formulae allow to calculate, with sufficient precision, wide-band filters, as well as filters with loss-compensation in certain circuits. There are 11 figures and 10 references: 6 Soviet-bloc, 4 non-Soviet-bloc. The three references to English-language publications read as follows: Lepage, Seely. General network analysis. Ch. VII Mc, Graw-Hill Co. 1952 Dishal. "Design of dissipative band-pass filters producing desired exact amplitude-frequency characteristics;" Dishal. "Exact design and analysis of double- and triple - tuned band-pass amplifiers". PIRE, June 1947.

"Feasibility of Using Mathematical Logic Models in Studying the Operation of Field Pharmacies"

Prague, Vojenske Zdravotnicke Listy, Vol 35, No 5, Oct 66, pp 189-193

Abstract [Czech, Russian and English summaries, modified]: The feasibility is described of using queuing theory and the Monte Carlo method in studying the operation of military pharmacies under field conditions. The suitability is demonstrated of this method for simulating many versions of the investigated process, even a fraction of which could not be simulated physically. The selection of the specific numerical method for the given problem is explained, and suggestions are made for the further elaboration of the employed methods, primarily in the direction of linear programming. Simulation on an electronic computer is described briefly, and the required computer time is given. One Western and eight Soviet-bloc references.

AUTHORS: Ovcharenko, B. G., Golovko, A. F., Vosvilov, N. M., Avilova, M. K.
TITLE: Experiment of Applying a Column of the Ammonia Synthesis With
a Top GIAP-DATZ (Opyt ekspluatatsii kolonn sinteza ammiaka s
nasadkoy GIAP-DATZ)
PERIODICAL: Khimicheskaya promyshlennost', 1959, Nr 3, pp 82-85 (USSR)
ABSTRACT: Until recently the Dneprodzerzhinskiy azotnotukovyy zavod
(Dneprodzerzhinsk Nitrogen Fertilizer Works) used a supple-
mented attachment according to Fauser with two tubular heat
exchangers and a secondary pipe for supplying cold gas (Fig 1).
It was found out however, that this attachment does not offer
optimum temperature conditions. In 1950 a new type of attach-
ment was developed in the GIAP by S. S. Lachinov and
constructed in the DATZ in two constructional types (Fig 2).
The attachment has two heat exchangers in the catalyst chamber,
and 2 secondary pipes for the supply with cold gas, and it is
called GIAP-DATZ (abbr. GD-2). Some data are given on the
application of a column (D = 0.85, H = 14 m) with a attachment
GD-2 and iron catalysts with two accelerators (K_2O and Al_2O_3).

Card 1/2

SOV/64-59-3-19/24

Experiment of Applying a Column of the
Ammonia Synthesis With a Top GIAP-DATZ

The results achieved after 1- and 6 months of its application (Table 1) show that $\Delta \% \text{NH}_3 \approx 12.5$ (ΔNH_3 = difference in % of the NH_3 content before and after the column) and the maximum capacity amount to 120-125 t/day, while it only was 100 t/day with the old type. Corresponding experiments were carried out in order to examine the effect of the second secondary pipe for cold gas on the increase of the capacity after one year, the results are given (Table 2). A column with an attachment GD-2 can work very stably, also with a gas supply up to 30% through the second secondary cold gas pipe, this caused an increase in the capacity by 70%. Examinations carried out during 20 days on a column which already had worked for 1.5 months showed (Table 3) that 140 t NH_3 /day are yielded with $\Delta \% \text{NH}_3 \approx 13$ and with a gas circulation of about 70,000 Nm^3 /hour, with the attachment GD-2 on the active catalyst. There are 2 figures and 3 tables.

TITLE: On the influence of impurities upon the photoconductivity of NaCl crystals coloured by X-rays

PERIODICAL: Physica status solidi, V.2, no.7, 1962, 829-840.

TEXT: The paper evaluates the measured dependence of photoconductivity upon thermal and optical bleaching in radiative coloured NaCl crystals grown in either porcelain (Pc-crystals) or platinum (Pt-crystals) crucibles. Results are plotted as η versus N_F . (η is the quantum yield, w the free electron path in unit field, N_F is the concentration of F-centers). The curves obtained characterise the way the crystal was grown and bleached. Differences are due to the relative high OH^- ion concentration in the Pt - crystals. Thermal

On the influence of impurities....

bleaching curves lie entirely below the colouring curve for Pc-crystals, and partly above partly below for the Pt crystals. Optical bleaching curves for both crystals have a negative slope. Significant differences between Pc crystals and Pt crystals are obtained after resting the samples subsequent to their partial optical bleaching. Absorption spectra of the samples were also measured. The results can be explained qualitatively by assuming a light OH^- concentration in Pt-crystals, and postulating a new colouring process for such crystals, involving the dissociation of OH^- ions under irradiation. There are 15 figures. ✓

Orig Pub : Magyar fiz. folyoirat, 1957, 5, No 1, 47-56

Abstract : Description of a portable dosimeter, intended for measurement of erythemic radiation under field conditions. The instrument is provided with interchangeable cadmium and sodium photocells and correcting light filters, ultraviolet glass, and UG-5 glass, which make the curves of spectral sensitivity of the photocells nearly equal to the curve of the erythemic radiation. A vacuum tube voltmeter is used to amplify the photoelectric currents. The output instrument is a 50 microamp microammeter. The amplifier and the photocells are fed from dry cells. The sensitivity of the dosimeter with cadmium photocell is 550 mV/cm² over the entire scale. For the sodium photocell, the sensitivity is 27.5 mV/cm² over the

The dependence of photocurrent from the number of F centers in x-irradiated NaCl crystals. Imre Tarján, Rudolf Voszka, and Agnes Somló, *Magyar Fiz. Polyoiral.* 8, 21-30 (1960).—Photocond. as a function of the concn. of F centers, N_F , were detd. on natural crystals, and crystals grown from liquid and tempered for 4 weeks at 350°. x-irradiation was carried out at intervals. After each interval the absorption coeff. and photocurrent were measured at max. F-center absorption. The photocurrent has a max. at a certain F-center concn., which is lower for natural than for artificial NaCl crystals. The product of quantum efficiency and electron displacement per unit space charge was calcd. from these data. Artificial crystals have more defects than natural, and these increase more by x-irradiation.

TITLE: Solution of removing water from the surface of metal parts
and also protecting them

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 14, 1962, 352, abstract
141274 (Czechoslovak Patent 98402, February 15, 1961)

TEXT: It is suggested that the usual drying of metal parts after degreasing and washing them be replaced by treatment in a solution which has the following composition (% by volume): naphthenic acids (with a molecular weight. > 300) 60, colophonic acids 10, glycerin 20, triethylamine 10, in 2.5% motor oil. It is advantageous to introduce 2.3% by volume Zn naphthenate and 3% lanolin into the solution as a corrosion inhibitor. The drying action of the solution is based on the fact that nearly all its components have a greater polarity than water. Dipping in such a solution for 5 min provides temporary protection against atmospheric corrosion for 14 days. ✓

Magnetic Effects

3734. The screw-like motion of metallic particles of size 10^{-3} to 10^{-1} cm in a magnetic field. E. VOJATA, *Acta Phys. Austriaca*, 5, 177-84 (No. 2, 1951) in German.

538.69 : 535.314

Further experiments on the so-called Ehrenhaft effect. Investigations were carried out on small iron and steel particles moving under the action of a magnetic field and an intense light beam. The following types of motion were observed visually and micro-photographically: (a) translation parallel to the lines of force, (b) rotation without translation, (c) screw-like translation. The last type was found to depend on the field strength and the light intensity.

<p>A microanalytical study of artificial sweetening agents. Jan Votava, <i>Food Chemistry</i>, 55, 303 (1971). The Salkowski method (C. A. 28, 10011) for detecting saccharin (the saccharin diffuses from an acidified solution into ether and then is adsorbed upon a paper impregnated with MgO) is satisfactory for beer, fruit juices, lemonade, ice cream, candies and confectionary. Other foods must be prepd. before the method is applied. Pickle juices and brines must be evapor. to dryness on a water bath, moistened with KOH and reevapd. to dryness 5 times, extd. with H_2O and acidified with H_2SO_4. Preserved fish, fish salads, fish pastes, etc., must be ground with an equal wt. of Glauber's salt contg. sand, and then extd. with water and filtered. The filtrates are evapor. to dryness, moistened with KOH, oxidized with a $Mg(MnO_2)$ soln. and dried. In mouth washes, toothpastes, etc., the solid and other aromatic compds. are removed partly during the evapor. of the soln. to dryness and partly by the addition of powder. $NaHCO_3$. 13-III-4

Determination of saccharin in beverages, foodstuffs, mouth washes, tooth pastes and powders. J. Yotz, (Z. Zuckerm., Chemokov., 1937, 63, 121-125).—The method of Stank and Farias (B., 1934, 696) can be applied to a variety of products. Addition of KOH accelerates extraction of saccharin by the Et_2O but is not essential. The aq. layer must be acidified (e.g., with H_2SO_4), and the MgO paper must not touch the aq. layer. Products containing acids or flavouring materials etc. in Et_2O need pre-treatment, e.g., volatile acids are largely removed by repeated evaporation with EtOH , and many flavourings by mixing the substance with NaHCO_3 and extracting with Et_2O . Fish products may be first ground with Na_2CO_3 and then extracted with H_2O , and many interfering substances may be oxidised with K_2MnO_4 (I), which may be applied also to the MgO paper and excess of (I) reduced by KOH before the paper is finally tested. During the Production Season of 1956-1957.

Orig Pub: Listy cukrovarn., 1957, 73, No 8, 185-190.

Abstract: Description of the results of repeated tests of treatment and return of bagasse water. After a preliminary mechanical purification the water was fed to diffusion on replenishing and start of juice withdrawal. Fresh water was added to the battery only during periods between withdrawals. Bagasse water was deliberately not preheated and not disinfected and elevated temperature was maintained in the diffusion

battery (starting from the 2nd tailings diffuser). The observed increased activity of microorganisms was caused not by bagasse water but by poor quality of beets. Disinfection of battery with formaldehyde yielded positive results. Tested in operation was the apparatus of Scheibler for the separation of pulp which yielded satisfactory results. Total losses in the diffusion battery on operation with the use of bagasse water amounted to 0.343% of the weight of beets. Operation of the same battery with pure water resulted in losses of 0.364% of the weight of the beets. In view of the economic advantages of this method of operation it will be further improved at the plant and rendered automatic.
